Mentimeter

ADLC IS HOW WE BUILD

Our craft evolves. Our accountability for what reaches production stays.

Then, we wrote the code.
Now, we write it with the agents.
Next, we all align on one clear way to get work done.

Agentic Development Lifecycle

Five Reasons to Work the Same Way

	Why	What We Will Measure
1	**Shared learning** Each team's progress *helps* others.	Shared improvements used by other teams, making us faster
2	**More time on customer problems** Less work on local tools and workflows.	Time spent on local tools and in-workflows
3	**Easier team moves for ICs** A familiar path from code to production.	Time to first safe production change after joining or moving teams
4	**Better speed, quality and cost** Choose models centrally using evidence.	Cost per verified change
5	**Skills for working with agents** Engineers can direct and check agent work.	Engineers who can complete the shared workflow independently

Track quality and speed alongside cost. Agree targets, owners and review dates.
Use available baselines and set dates to collect missing data.

One Engineering Standard

Required

One lifecycle and one code-to-production process

Vanilla ADLC across every team. The same authoring and deployment process.

Golden Path

One shared harness

The default for everyone. Variance is ok.

Required

One AI gateway; one centralized token provider

Required for every team and individual.

Buy, borrow, last build, as always. Methodology and harness come off the shelf, for now.

Six deliverables. Done looks different for each.

For each of the six outstanding deliverables, **work through the unknowns and recommend a way forward** so we can move forward with the hypothesis.

Depending on your findings, “done” could be as simple as “this can wait” or as detailed as a full recommendation. The goal is to **shape something we can launch within weeks**, with confidence that it is mature enough – without overengineering the solution to perfection.

Your **recommendations and setup will form version 1.0**, a baseline we can learn from and refine over time. We prioritize a **fast launch and a clear bias toward action**, keeping debate focused on what we need to move forward.

The Method, Harness and Model Access

1 Vanilla ADLC

Use published ADLC stages, gates and artifacts.
Keep its names and structure so we can adopt updates; we will not innovate here.

2 One Harness

Choose an existing harness that supports ADLC concepts and the shared gateway approach.

3 One Gateway and Token Provider

Recommend a gateway, comparing Vercel AI Gateway and OpenRouter (et al).
Define routing, spend tracking, approved providers and retention controls.

The Rollout, Playbook and Evaluation

4 A Rollout Plan for Every Team

Define what counts as adoption. Set each team's dates, owner and support.
Keep delivery moving and make the first step clear.

5 A Playbook Engineers Can Follow

Show what good looks like on artifact level and how to judge it, with good and bad examples.
Include specs, setup, checks, failed gates and onboarding.

6 Model Evals and Measures of Progress

Compare models on Menti-relevant work for speed, quality of outcomes and cost.
Propose any custom evals needed and how to track the outcomes. Here we can build.

Rafael Leads. Didde is Accountable

Rafael

Workstream Lead

Dedicated capacity for design, implementation and continuous evaluation of ADLC in our WoW.

Jaunius

Second to Rafael

Partners on the work.

Patrik

Engineering Director

Supports team rollout plans and training.
Helps resolve delivery conflicts.

Didde

Accountable and Approver

Involved throughout the push.
Approver of proposal and plans.

Product Ops joins the work.

Agree shared terms and handoffs with the unified Product Development Methodology.
Both efforts run in parallel. Neither waits for the other. Decoupling makes us faster.

~Two Weeks to an Approved Plan

Week 1

Choose and Draft

Compare harness and gateway options.
Draft the playbook with teams.
Define rollout dates and support.
Agree measures and data sources.

Week 2

Test and Approve

Walk a real change through ADLC.
Show what happens when a check fails.
Test the guide with a first-time user.
Get CTO approval and align with Anna B.

By the End of Week 2

The CTO approves all six deliverables. The plan sets each team’s adoption date.
An engineer outside the group can follow the playbook without an oral handover.

The Direction is Set

Every engineer adopts the shared way of working and takes responsibility for their growth.

“Follow your team’s rollout plan and ask for help early.”

In Two Weeks

An approved approach, with rollout dates and an owner for every team.

We will work through friction by including many, including early.
The direction stands and we ship to learn. We iterate on learnings, not preference or assumptions.
